# Picturing Quantum Processes

*A first course in quantum theory  
and diagrammatic reasoning*

COECKE | KISSINGER

CAMBRIDGE

# Picturing Quantum Processes

# Picturing Quantum Processes

When two systems [...] enter into temporary physical interaction due to known forces between them, [...] then they can no longer be described in the same way as before, viz. by endowing each of them with a representative of its own. **I would not call that one but rather the characteristic trait of quantum mechanics**, the one that enforces its entire departure from classical lines of thought.

— *Erwin Schrödinger, 1935.*

# Picturing Quantum Processes

When two systems [...] enter into temporary physical interaction due to known forces between them, [...] then they can no longer be described in the same way as before, viz. by endowing each of them with a representative of its own. **I would not call that one but rather the characteristic trait of quantum mechanics, the one that enforces its entire departure from classical lines of thought.**

— *Erwin Schrödinger, 1935.*

In quantum theory, *interaction* of systems is everything. **Diagrams** are the language of interaction.

# Picturing Quantum Processes

**Q:** How much of quantum theory can be understood just using diagrams and diagram transformation?

# Picturing Quantum Processes

**Q:** How much of quantum theory can be understood just using diagrams and diagram transformation?

**A:** Pretty much everything!

Applications: a Hollywood-style trailer

## Processes

- A **process** is anything with zero or more *inputs* and zero or more *outputs*

# Processes

- A **process** is anything with zero or more *inputs* and zero or more *outputs*
- For example, this **function**:

$$f(x, y) = x^2 + y$$

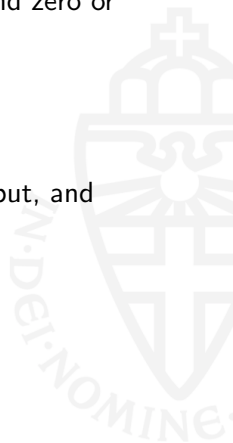

# Processes

- A **process** is anything with zero or more *inputs* and zero or more *outputs*
- For example, this **function**:

$$f(x, y) = x^2 + y$$

...is a process when takes two real numbers as input, and produces a real number as output.

# Processes

- A **process** is anything with zero or more *inputs* and zero or more *outputs*
- For example, this **function**:

$$f(x, y) = x^2 + y$$

...is a process when takes two real numbers as input, and produces a real number as output.

- We could also write it like this:

# Processes

- A **process** is anything with zero or more *inputs* and zero or more *outputs*
- For example, this **function**:

$$f(x, y) = x^2 + y$$

...is a process when takes two real numbers as input, and produces a real number as output.

- We could also write it like this:

# Processes

- A **process** is anything with zero or more *inputs* and zero or more *outputs*
- For example, this **function**:

$$f(x, y) = x^2 + y$$

...is a process when takes two real numbers as input, and produces a real number as output.

- We could also write it like this:

- The labels on wires are called **system-types** or just **types**

## More processes

- Similarly, computer programs are processes

## More processes

- Similarly, computer programs are processes
- For example, a program that sorts lists might look like this:

## More processes

- Similarly, computer programs are processes
- For example, a program that sorts lists might look like this:

- These are also perfectly good processes:

## Diagrams

- We can combine simple processes to make more complicated ones, described by **diagrams**:

## Diagrams

- We can combine simple processes to make more complicated ones, described by **diagrams**:

- The golden rule: **only connectivity matters!**

# Types

- Connections are only allowed where the **types match**

# Types

- Connections are only allowed where the **types match**, e.g.:

# Types

- Connections are only allowed where the **types match**, e.g.:

# Types

- Connections are only allowed where the **types match**, e.g.:

# Types

- Connections are only allowed where the **types match**, e.g.:

- Types tell us when it **makes sense** to plug processes together

# Types and Process Theories

- Ill-typed diagrams are undefined:

## Types and Process Theories

- Ill-typed diagrams are undefined:

- In fact, these processes don't ever make sense to plug together

## Types and Process Theories

- Ill-typed diagrams are undefined:

- In fact, these processes don't ever make sense to plug together
- A family of processes which do make sense together is called a **process theory**

## Types and Process Theories

- Ill-typed diagrams are undefined:

- In fact, these processes don't ever make sense to plug together
- A family of processes which do make sense together is called a **process theory**, e.g.
  - **functions**
  - **linear maps**
  - **optical devices**
  - **proofs, ...**

## Special processes: states and effects

- Processes with no inputs are called **states**:

## Special processes: states and effects

- Processes with no inputs are called **states**:

**Interpret as:** preparing a system in a particular configuration, where we don't care what came before.

## Special processes: states and effects

- Processes with no inputs are called **states**:

**Interpret as:** preparing a system in a particular configuration, where we don't care what came before.

- Processes with no outputs are called **effects**:

## Special processes: states and effects

- Processes with no inputs are called **states**:

**Interpret as:** preparing a system in a particular configuration, where we don't care what came before.

- Processes with no outputs are called **effects**:

**Interpret as:** testing for a property  $\pi$ , where we don't care what happens after.

# Numbers

- A **number** is a process with no inputs or outputs, written as:

or just:  $\lambda$

# Numbers

- A **number** is a process with no inputs or outputs, written as:

$$\diamond \lambda \quad \text{or just:} \quad \lambda$$

- Numbers always form a commutative monoid:

$$\diamond \lambda \cdot \diamond \mu \quad := \quad \diamond \lambda \diamond \mu \quad \quad 1 := \boxed{\phantom{\lambda}}$$

# Numbers

- A **number** is a process with no inputs or outputs, written as:

$$\diamond \lambda$$

or just:  $\lambda$

- Numbers always form a commutative monoid:

$$\diamond \lambda \cdot \diamond \mu := \diamond \lambda \diamond \mu \quad 1 := \square$$

- Interpret as:** what happens when a state meets an effect

$$\left. \begin{array}{l} \text{effect} \left\{ \begin{array}{c} \triangle \pi \\ \downarrow \\ \triangle \psi \end{array} \right\} \\ \text{state} \end{array} \right\} \text{number}$$

# Numbers

- A **number** is a process with no inputs or outputs, written as:

$$\diamond \lambda$$

or just:  $\lambda$

- Numbers always form a commutative monoid:

$$\diamond \lambda \cdot \diamond \mu := \diamond \lambda \diamond \mu \quad 1 := \square$$

- Interpret as:** what happens when a state meets an effect, e.g.

# Numbers

- A **number** is a process with no inputs or outputs, written as:

$$\diamond \lambda \quad \text{or just:} \quad \lambda$$

- Numbers always form a commutative monoid:

$$\diamond \lambda \cdot \diamond \mu := \diamond \lambda \diamond \mu \quad 1 := \square$$

- Interpret as:** what happens when a state meets an effect, e.g.

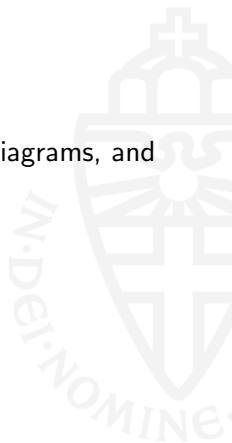

$$\left. \begin{array}{l} \text{effect} \left\{ \begin{array}{c} \triangle \pi \\ \downarrow \\ \triangle \psi \end{array} \right\} \\ \text{state} \end{array} \right\} \text{probability}$$

This is called the (generalised) **Born rule**

# Process theories in general

**Q:** What kinds of behaviour can we study using just diagrams, and nothing else?

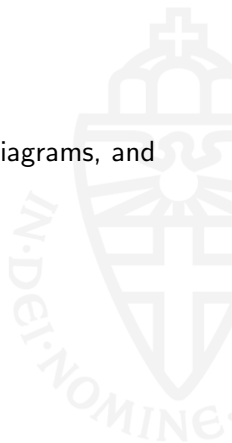

## Process theories in general

**Q:** What kinds of behaviour can we study using just diagrams, and nothing else?

**A:** (Non-)separability

## Separable states

- States can be on a single system, two systems, or many systems:

## Separable states

- States can be on a single system, two systems, or many systems:

- A state  $\psi$  on two systems is  $\otimes$ -separable if there exist  $\psi_1, \psi_2$  such that:

## Separable states

- States can be on a single system, two systems, or many systems:

- A state  $\psi$  on two systems is  $\otimes$ -separable if there exist  $\psi_1, \psi_2$  such that:

- Intuitively:** the properties of the system on the left are *independent* from those on the right

## Separable states

- States can be on a single system, two systems, or many systems:

- A state  $\psi$  on two systems is  $\otimes$ -separable if there exist  $\psi_1, \psi_2$  such that:

- Intuitively:** the properties of the system on the left are *independent* from those on the right
- In classical (deterministic) world, we expect *all states* to  $\otimes$ -separate

## Characterising non-separability

- ...which is why non-separable states are way more interesting!

## Characterising non-separability

- ...which is why non-separable states are way more interesting!
- But, how do we know we've found one?

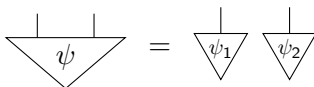

# Characterising non-separability

- ...which is why non-separable states are way more interesting!
- But, how do we know we've found one?
- i.e. that there do **not** exist states  $\psi_1, \psi_2$  such that:

## Characterising non-separability

- ...which is why non-separable states are way more interesting!
- But, how do we know we've found one?
- i.e. that there do **not** exist states  $\psi_1, \psi_2$  such that:

$$\begin{array}{c} | \\ | \\ \hline \psi \\ \hline \end{array} = \begin{array}{c} | \\ \hline \psi_1 \\ \hline \end{array} \begin{array}{c} | \\ \hline \psi_2 \\ \hline \end{array}$$

- **Problem:** Showing that something **doesn't** exist can be hard.

## Characterising non-separability

**Solution:** Replace a **negative** property with a (stronger) **positive** one:

# Characterising non-separability

**Solution:** Replace a **negative** property with a (stronger) **positive** one:

## Definition

A state  $\psi$  is called *cup-state* if there **exists an effect**  $\phi$ , called a *cap-effect*, such that:

## Cup-states

- By introducing some clever notation:

# Cup-states

- By introducing some clever notation:

- Then these equations:

# Cup-states

- 2 **processes:** complex linear maps

...in particular, numbers are *complex numbers*.

## Hilbert space

Looking at the 'Born rule' for **linear maps**, we have a problem:

# Hilbert space

Looking at the 'Born rule' for **linear maps**, we have a problem:

$$\left. \begin{array}{l} \text{effect} \\ \text{state} \end{array} \right\} \left\{ \begin{array}{c} \triangle \phi \\ \downarrow \\ \nabla \psi \end{array} \right\} \text{complex number}$$

# Hilbert space

Looking at the 'Born rule' for **linear maps**, we have a problem:

$$\begin{array}{l}
 \text{effect} \\
 \text{state}
 \end{array}
 \left\{ \begin{array}{c}
 \triangle \phi \\
 \downarrow \\
 \nabla \psi
 \end{array} \right\} \text{complex number} \neq \text{probability!}$$

# Doubling

**Solution:** multiply by the conjugate:

# Doubling

**Solution:** multiply by the conjugate:

Then, for normalised  $\psi, \phi$ :

$$0 \leq \begin{array}{c} \triangle \phi \\ | \\ \triangle \psi \end{array} \begin{array}{c} \triangle \phi \\ | \\ \triangle \psi \end{array} \leq 1$$

# Doubling

**Solution:** multiply by the conjugate:

Then, for normalised  $\psi, \phi$ :

$$0 \leq \begin{array}{c} \triangle \phi \\ | \\ \triangle \psi \end{array} \begin{array}{c} \triangle \phi \\ | \\ \triangle \psi \end{array} \leq 1$$

(i.e. the 'usual' Born rule:  $\overline{\langle \phi | \psi \rangle} \langle \phi | \psi \rangle = |\langle \phi | \psi \rangle|^2$ )

# Doubling

**New problem:** We lost this:

# Doubling

**New problem:** We lost this:

...which was the basis of our interpretation for states, effects, and numbers.

## Doubling

**Solution:** Make a new process theory with doubling 'baked in':

# Doubling

**Solution:** Make a new process theory with doubling 'baked in':

# Doubling

**Solution:** Make a new process theory with doubling 'baked in':

Then:

# Doubling

The new process theory has doubled systems  $\hat{H} := H \otimes H$ :

$$| \quad := \quad \boxed{\quad} \boxed{\quad}$$

# Doubling

The new process theory has doubled systems  $\hat{H} := H \otimes H$ :

$$| \quad := \quad \begin{array}{|l} \hline | \\ \hline \end{array}$$

and processes:

$$\text{double} \left( \begin{array}{|c} \hline | \\ \hline \end{array} \begin{array}{|c} \hline / \\ \hline \end{array} \begin{array}{|c} \hline | \\ \hline \end{array} \right) := \begin{array}{|c} \hline \hat{f} \\ \hline \end{array} = \begin{array}{|c} \hline \begin{array}{|c|c|} \hline \begin{array}{|c} \hline / \\ \hline \end{array} \begin{array}{|c} \hline / \\ \hline \end{array} \\ \hline \end{array} \\ \hline \end{array}$$

# Doubling preserves diagrams

# ...but kills global phases

$$\diamond_{\lambda} \diamond_{\lambda} = \square$$

(i.e.  $\lambda = e^{i\alpha}$ )

# ...but kills global phases

$$\widehat{\lambda} \lambda = \boxed{\phantom{\lambda}} \quad (\text{i.e. } \lambda = e^{i\alpha})$$

$$\text{double} \left( \begin{array}{c} \lambda \\ f \end{array} \right) = \begin{array}{c} \diagdown \\ f \\ \diagup \end{array} \widehat{\lambda} \lambda \begin{array}{c} \diagup \\ f \\ \diagdown \end{array} = \begin{array}{c} \diagdown \\ f \\ \diagup \end{array} \begin{array}{c} \diagup \\ f \\ \diagdown \end{array} = \begin{array}{c} \widehat{f} \end{array}$$

## Discarding

Doubling also lets us do something we couldn't do before:

# Discarding

Doubling also lets us do something we couldn't do before: throw stuff away!

# Discarding

Doubling also lets us do something we couldn't do before: throw stuff away!

How? Like this:

# Discarding

For normalised  $\psi$ , the two copies annihilate:

# Quantum maps

## Definition

The process theory of **quantum maps** has as types (doubled) Hilbert spaces  $\hat{H}$  and as processes:

## Two characterisations of 'pure'

No discarding involved, i.e. for some  $f$ :

## Two characterisations of 'pure'

No discarding involved, i.e. for some  $f$ :

Any *extension* is trivial:

# Quantum processes

Causality generalises to cq-maps:

# Quantum processes

Causality generalises to cq-maps:

**quantum processes** := causal **cq-maps**

## Special case: quantum measurements

A *measurement* is any **quantum process** from a quantum system to a classical one:

## Special case: quantum measurements

A *measurement* is any **quantum process** from a quantum system to a classical one:

Special case:

## Special case: controlled-operations

A **quantum process** with a classical input is a *controlled operation*:

## Special case: controlled-operations

A *controlled isometry* furthermore satisfies:

## Special case: controlled-operations

Suppose we can use a single  $\hat{U}$  to build a *controlled isometry*:

## Special case: controlled-operations

Suppose we can use a single  $\hat{U}$  to build a *controlled isometry*:

...and an ONB measurement:

## Quantum teleportation: take 2

...then teleportation is a snap!

## Quantum teleportation: take 2

...then teleportation is a snap!

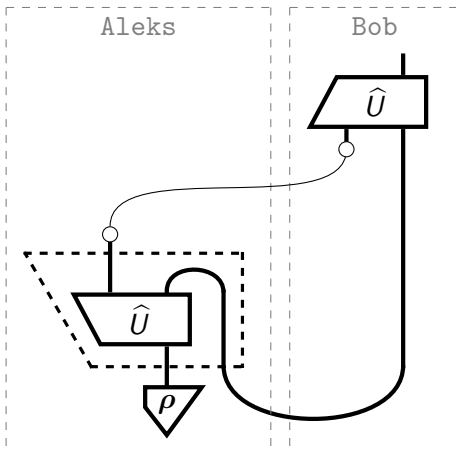

## Quantum teleportation: take 2

...then teleportation is a snap!

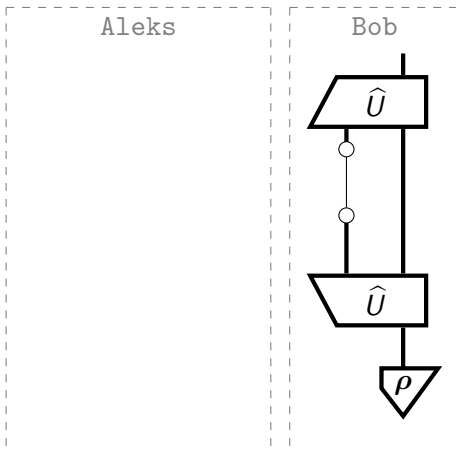

## Quantum teleportation: take 2

...then teleportation is a snap!

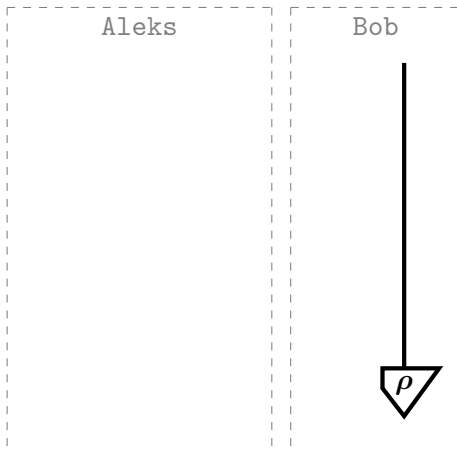

## Quantum teleportation: take 2

...then teleportation is a snap!

## Quantum teleportation: take 2

...then teleportation is a snap!

# Complementary bases

# Complementary bases

# Complementarity

# Complementarity

## Interpretation:

(encode in  $\circ$ ) THEN (measure in  $\bullet$ ) = (no data flow)

# Consequence: Stern-Gerlach

# Quantum computation

Doubling a classical spider gives a *quantum spider*:

# Universality

By decorating quantum spiders with *phases*:

$$\begin{array}{c} \dots \\ \diagup \quad \diagdown \\ \textcircled{\alpha} \\ \diagdown \quad \diagup \\ \dots \end{array} = \text{double} \left( \begin{array}{c} \downarrow \quad \dots \quad \downarrow \\ 0 \quad \dots \quad 0 \\ \uparrow \quad \dots \quad \uparrow \\ 0 \quad \dots \quad 0 \\ | \quad \dots \quad | \end{array} + e^{i\alpha} \begin{array}{c} \downarrow \quad \dots \quad \downarrow \\ 1 \quad \dots \quad 1 \\ \uparrow \quad \dots \quad \uparrow \\ 1 \quad \dots \quad 1 \\ | \quad \dots \quad | \end{array} \right)$$

# Universality

By decorating quantum spiders with *phases*:

$$\begin{array}{c} \dots \\ \diagup \quad \diagdown \\ \textcircled{\alpha} \\ \diagdown \quad \diagup \\ \dots \end{array} = \text{double} \left( \begin{array}{c} \downarrow 0 \quad \dots \quad \downarrow 0 \\ \uparrow 0 \quad \dots \quad \uparrow 0 \\ | \quad \dots \quad | \end{array} + e^{i\alpha} \begin{array}{c} \downarrow 1 \quad \dots \quad \downarrow 1 \\ \uparrow 1 \quad \dots \quad \uparrow 1 \\ | \quad \dots \quad | \end{array} \right)$$

we have:

$$\begin{array}{c} \dots \quad \dots \\ \diagup \quad \diagdown \\ \textcircled{\alpha} \\ \diagdown \quad \diagup \\ \dots \quad \dots \\ \diagup \quad \diagdown \\ \textcircled{\beta} \\ \diagdown \quad \diagup \\ \dots \quad \dots \end{array} = \begin{array}{c} \dots \\ \diagup \quad \diagdown \\ \textcircled{\alpha+\beta} \\ \diagdown \quad \diagup \\ \dots \end{array}$$

and spider-diagrams become **universal for quantum computation!**

## Soundness and completeness

**Restricting** the phase group to  $\mathbb{Z}_4 \cong \{0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}\} \subset U(1)$  gives *stabiliser QT*.

# Soundness and completeness

**Restricting** the phase group to  $\mathbb{Z}_4 \cong \{0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}\} \subset U(1)$  gives *stabiliser QT*.

# Measurement-based quantum computing

# Quantum algorithms

Spiders can be used to build *quantum oracles*:

⇒ simple derivations of **Deutsch-Jozsa**, **quantum search**, and **hidden subgroup** algorithms.

# GHZ/Mermin non-locality

# Multipartite entanglement

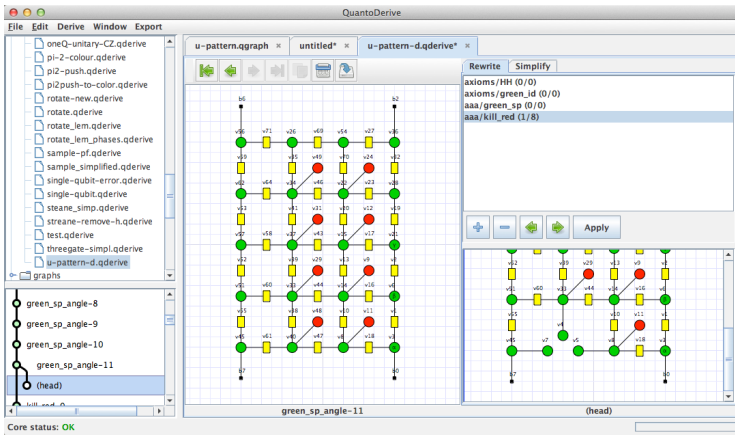

SLOCC-classification of 3 qubits:

# Automation

## Quantomatic:

The screenshot shows the Quantomatic software interface. The main window displays a quantum circuit diagram with nodes labeled v1 through v30. The nodes are arranged in a grid-like structure, with some nodes connected by lines. The nodes are colored green, yellow, and red. The diagram is labeled "green\_sp\_angle-11" at the bottom. On the left side, there is a file explorer showing a list of files, including "u-pattern-qgraph", "untitled\*", and "u-pattern-d.qderive". Below the file explorer, there is a list of nodes, including "green\_sp\_angle-8", "green\_sp\_angle-9", "green\_sp\_angle-10", "green\_sp\_angle-11", and "(head)". At the bottom left, the "Core status" is shown as "OK". On the right side, there is a panel with tabs for "Rewrite" and "Simplify". The "Rewrite" tab is active, showing a list of rewrite rules: "axioms/HH (0/0)", "axioms/green\_id (0/0)", "aaa/green\_sp (0/0)", and "aaa/kill\_red (1/8)". Below the list, there are buttons for "+", "-", a left arrow, a right arrow, and "Apply". At the bottom right, there is a smaller diagram labeled "(head)".

Thanks! Joint work with Bob Coecke (book):

...and many more!
